Project Description:

➤ From INEC: Polling units are under Wards, Wards are under LGA, LGAs are under states

➤ The central idea of this client project is that given all the individual results announced in the polling units(**announced_pu_results**) under any LGA, we should be able to get an estimated result for that LGA. This can then be cross-checked with the result announced at the local government level (**announced_lga_results**)

➤ Table: polling_unit contains a list of polling units (each polling unit has a ward ID, LGA, ID, and state ID)

➤ Table: ward contains a list of wards

➤ Table: LGA contains a list of LGA

➤ Table: "**announced_pu_results**" contains dummy results of various polling units.

NOTE: Result from each polling unit is stored on about 9 rows with the score from each party being individual rows.

i.   e for polling_unit_uniqueid = 8 we have results ad follows:
ii. PDP: 802, DPP: 719, ACN: 416, PPA: 939, CDC: 394, JP:

"polling_unit".uniqueid = "announced_pu_results".polling_unit_uniqueid(Note the difference between polling_unitid and polling_unit_uniqueid)

➤ Table: "announced_lga_results" contains dummy results of various local governments as announced at the local government coalition centre.

QUESTION 1
➤ Create a page to display the result of any individual polling unit on a web page.
➤ Note that the database you have been given only contains LGA's in Delta State (state id: 25)

QUESTION 2
➤ Create a page to display the summed total result of all the polling units under any particular local government.
➤ Local Government should be selected using a select box.
➤ Do **NOT** use the announced LGA result table to display this required result.
➤ The announced LGA table is designed to be used for a comparison of a summed total of all the polling unit results under any particular LGA

QUESTION 3
➤ Create a page to be used to store results for ALL parties for a new polling unit.
➤ Hints:
    ◆ We are testing your basic programming ability.
    ◆ Ensure your solution is VERY user friendly. For example, use a chained combo box where possible. (you may also browse any website of your choice to get code snippets and tutorials, if necessary).
